HW

GENERAL INFORMATION

LOCK TYPE CONNECTOR

PRECAUTION:

- Disconnection and connection of each connector should be kept at a minimum level. If unnecessary disconnection or connection is repeated, it may cause unexpected troubles such as poor continuity and chattering.

G2HW00002-00000

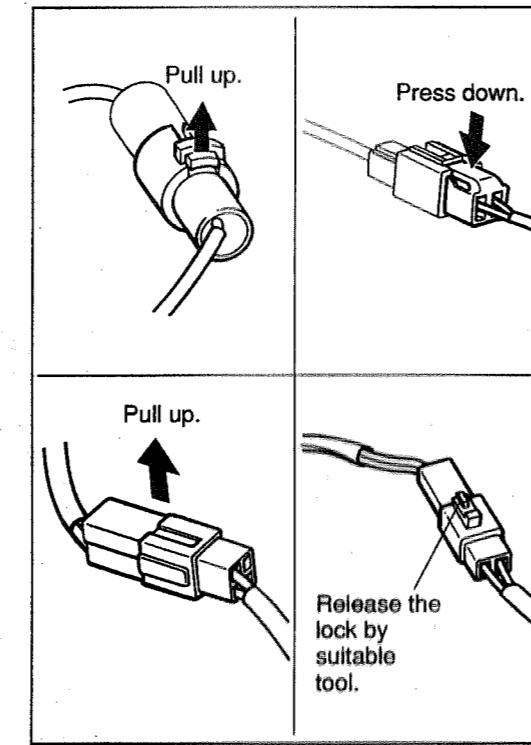

DISCONNECTION

The lock type of the connector comes in a push release type, a pull release type, a spring lock type, an one-way lock type and so on.

After confirming the shape of the lock, unlock the lock. Disconnect the connector while holding the connector by hand.

NOTE:

- Never pull the harness during the disconnection.
- Be sure to pull out the connector straight so as not to damage the terminal.

G2HW00003-00001

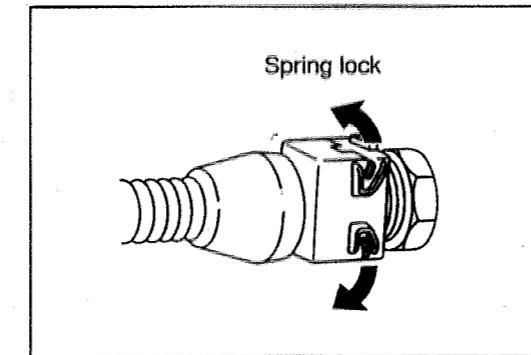

CONNECTION

Perform the connection until the lock is completely engaged.

After the connection has been made, ensure that the lock is engaged positively.

NOTE:

- Be sure to connect the connector straight so as not to damage the terminal.

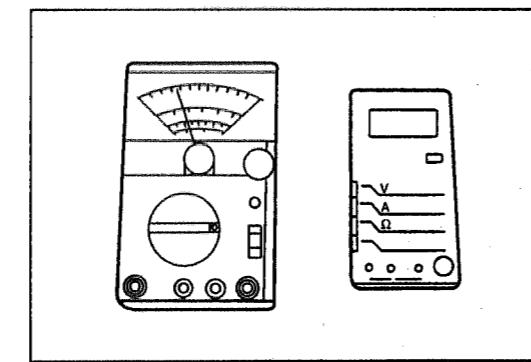

G2HW00004-00002

INSPECTION

Tester (Volt/ohmmeter)

For the inspection, use a tester having an internal resistance of more than 10 kΩ/V.

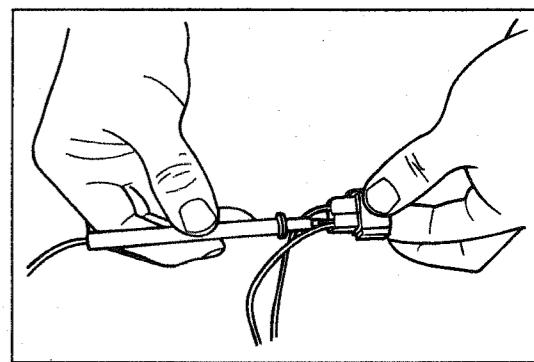

Use of a tester with a low internal resistance may cause wrong measurement or secondary troubles.

G2HW00005-00003

Conventional type connector

When resistance measurement and/or voltage measurement is conducted at the connector section, insert the measuring probe from the back of the connector, being very careful not to damage the harness-to-terminal connections.

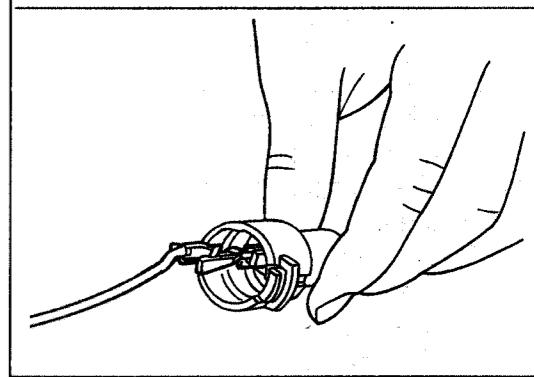

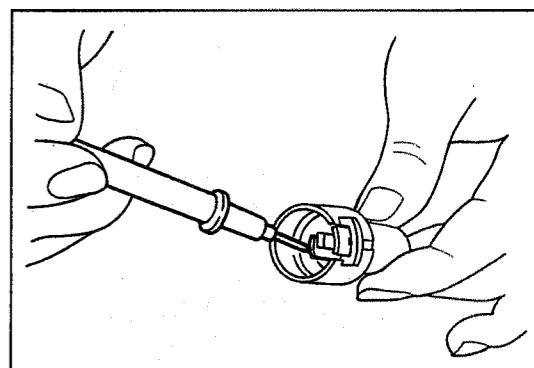

G2HW00006-00004

Water-proof type connector

When resistance measurement and/or voltage measurement is conducted at the connector section, bring the measuring probe into contact with the terminal at the connection side of the connector.

Be very careful not to apply excessive force to the terminal at the connector side. Failure to observe this caution may deform the terminal, causing poor continuity.

As an alternative method, insert a male or female terminal into the connector terminal or connect an adequate attachment. Then, connect the measuring probe.

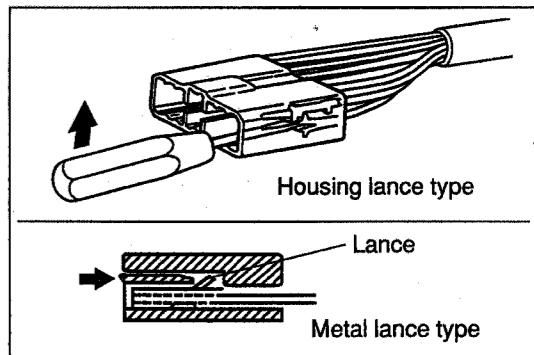

G2HW00007-00005

TERMINAL REMOVAL/INSTALLATION

Removal of terminal

<Housing lance type>

Insert a miniature screwdriver through the opening section of the connector into between the locking lug and the terminal. While prying up the locking lug with the screwdriver, pull the terminal backward.

G2HW00008-00006

<Metal lance type>

While pushing the lance with the screwdriver, pull the terminal backward.

Installation of terminal

<Housing lance type>

Push the terminal into the protruding section of the connector, until the lock is engaged completely.

Lightly pull the harness to assure that the locking has been made completely.

<Metal lance type>

Insert the terminal into the connector, until lance is locked completely.

Lightly pull the harness to assure that the locking has been made completely.

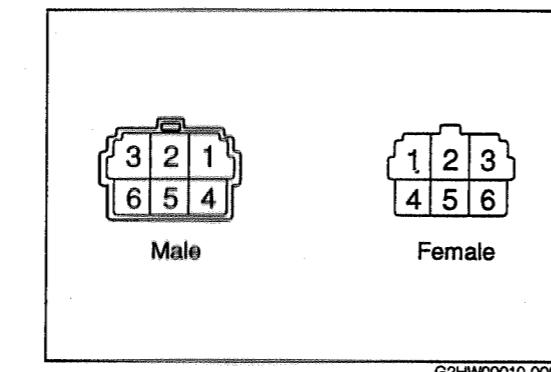

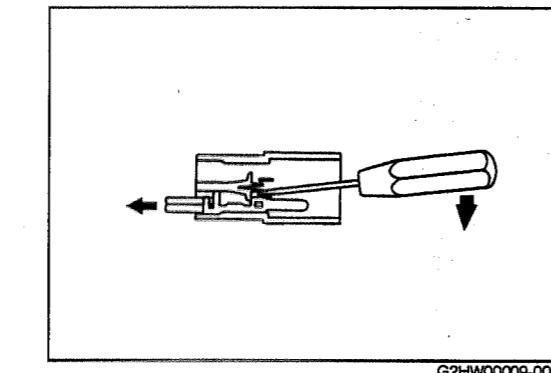

PIN NUMBER OF CONNECTOR

(1) Pin number of female connector

The numbering is made in sequence from the left/upper position to the right/under position.

(2) Pin number of male connector

The numbering is made in sequence from the right/upper position to the left/under position.

**OPERATION OF WIRE HARNESS****1. General instructions**

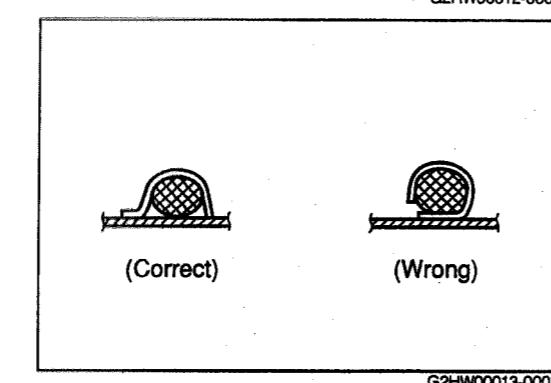

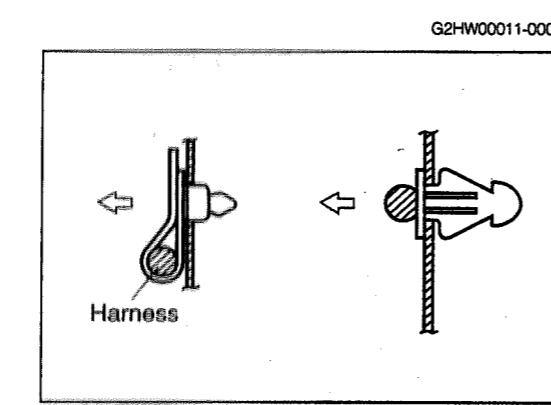

(1) Never pull the connectors or step on them during the wire harness transport or assembly.
(Prevention of pulling-out of terminals, connector cracks, deformation and so forth)

(2) Care must be exercised to ensure that no scratch is made to the wire harness by burrs or edges during the wire harness transport or assembly.
(Prevention of scratches to the outer trim, electrical insulators and so forth)

(3) Clamping method
In the case of resin clamps, ensure that the clamp section is fitted in the body hole.

NOTE:

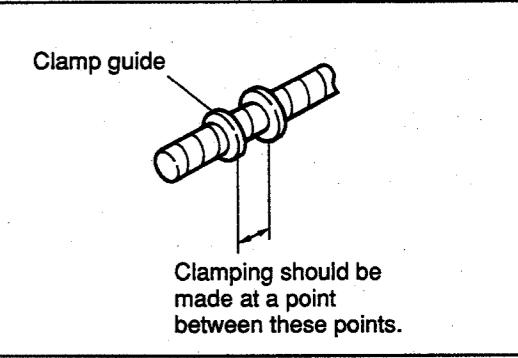

- Ensure that the clamp will not be detached when it is pulled lightly in the arrow-headed direction.
(Prevention of interference due to the detachment of the clamp)

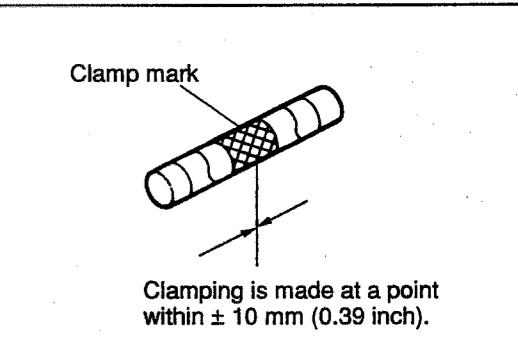

- In the case of metal sheet welded clamps, be sure to assemble the harness in such a way that the harness will not come in contact with the welded surface.

(Prevention of wire harness damage due to welding burrs)

- In case that the locating guide of the clamp position or the clamp mark is clamped, make sure that the clamp is located within the guide. As for the clamp at the clamp mark section, ensure that the clamping is made at a point within ± 10 mm (0.39 inch).

(Prevention of slackness or interference)

**(4) Terminals and connectors**

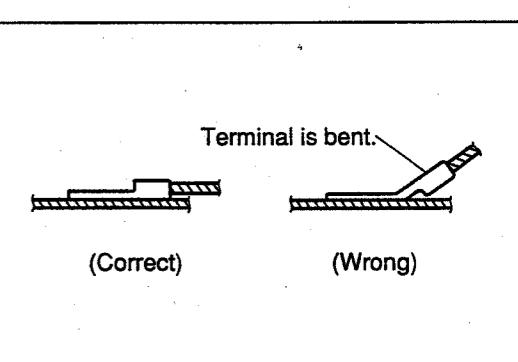

Perform the connection of connectors positively.

- Connector with lock Ensure that the locking is made.
- Connector without lock ... Connect the connector positively until it stops.

G2HW00016-00000

Retention by screws

- When the tightening torque is specified, be sure to observe the specification strictly.
(The tightening torque is posted in the table separately.)
- Ensure that the staked section may not come on the assembling surface.
- After completion of the tightening operation, lightly pull out the terminal. Ensure that there is no slackness.

- When performing other operations, care must be exercised to ensure that no connected connector is detached by pulling out the wire harness forcibly.

G2HW00018-00000

G2HW00018-00000

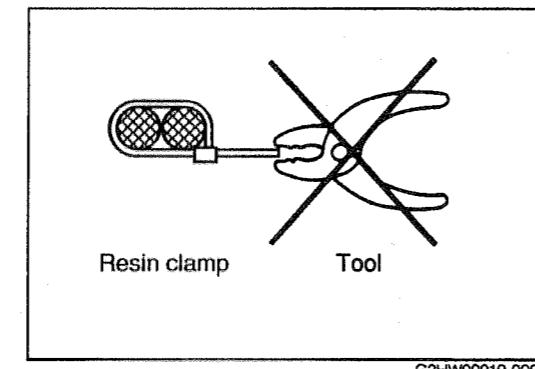

2. Work procedure for tightening-up type resin clamps

<Work procedure>

When the tightening-up type resin clamps are employed, do not use any pliers, cutting pliers or the like.

<Reason>

Prevention of clamps being cut or scratched

WIRING HARNESSES

WARNING:

- The wire diameter and capacity of each harness have been determined to assure the normal operation of the electrical system.
- Hence, do not take power for accessories carelessly through the original wiring harness. Failure to observe this caution may cause system malfunction or fire.

G2HW00020-00000

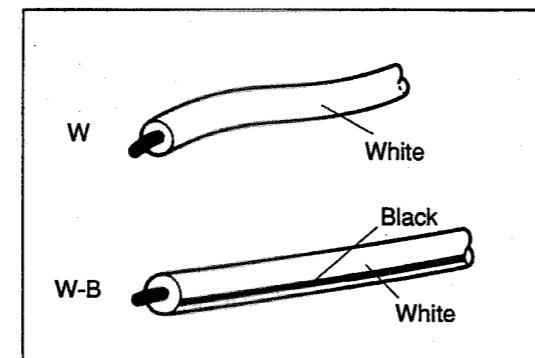

Wiring color code

- For identification purpose, each wire has its own color. Each color bears a code as described in the right table. These codes are used in the wiring diagram and will be helpful during trouble shooting.

Code	Gr	Br	B
Color	Gray	Brown	Black
Code	W	R	G
Color	White	Red	Green
Code	Y	L	O
Color	Yellow	Blue	Orange
Code	P	Lg	V
Color	Pink	Light green	Violet

G2HW00021-00000

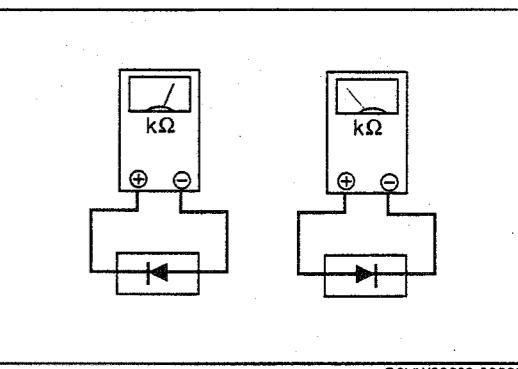

- The wire color comes in two kinds: single color and composite color. In the case of single color, the whole outer coat of the harness is of a single color. In the case of composite color, a fine line of the second color is drawn on the harness basic color. In this case, the code is composed of the basic color code which comes first and the second color code which comes after a hyphen.

INSPECTION OF CIRCUIT WITH TESTER

If a diode is built in the circuit, perform continuity test by changing the polarities of the measuring terminals.

In case of a general type tester, ensure that continuity exists when the negative (-) lead of the tester is connected to the positive (+) side of the diode; the positive (+) lead of the tester to the negative (-) side of the diode. Also ensure that no continuity exists when the polarities are changed.

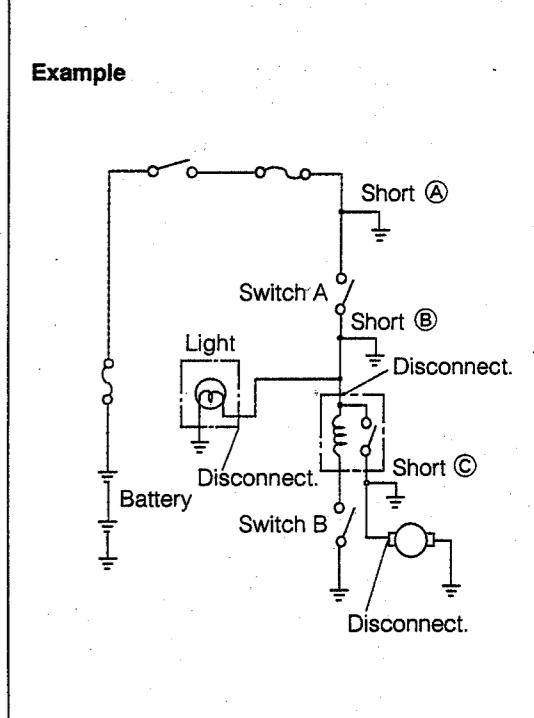

Since some testers have different polarities, be sure to read the instruction manual of a tester to be used for the check before using it.

The inspection procedure for light emitting diodes (LED) is the same as normal diodes. However, there may be cases where the LED emits no light, unless a tester with LED check mode is used. If an adequate tester is not available, apply the battery voltage to the LED and ensure that the LED emits light.

INSPECTION OF SHORT CIRCUIT

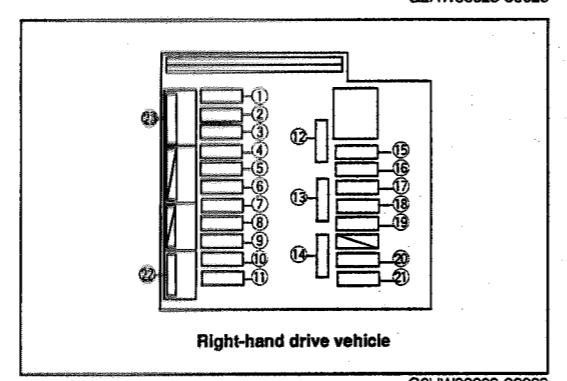

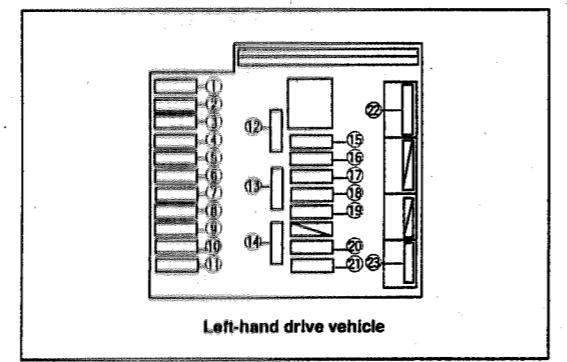

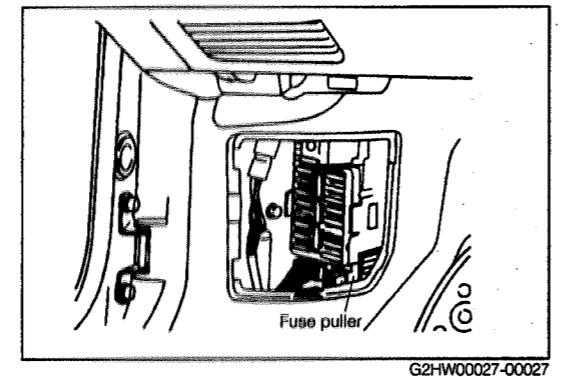

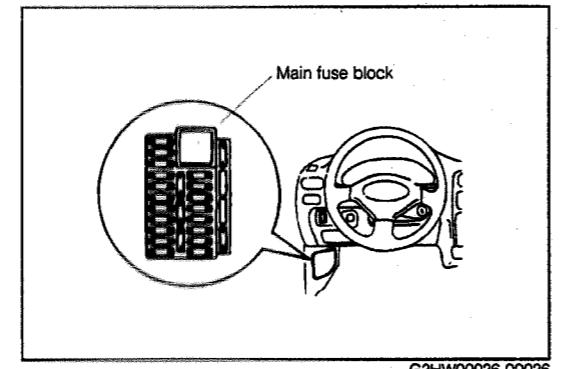

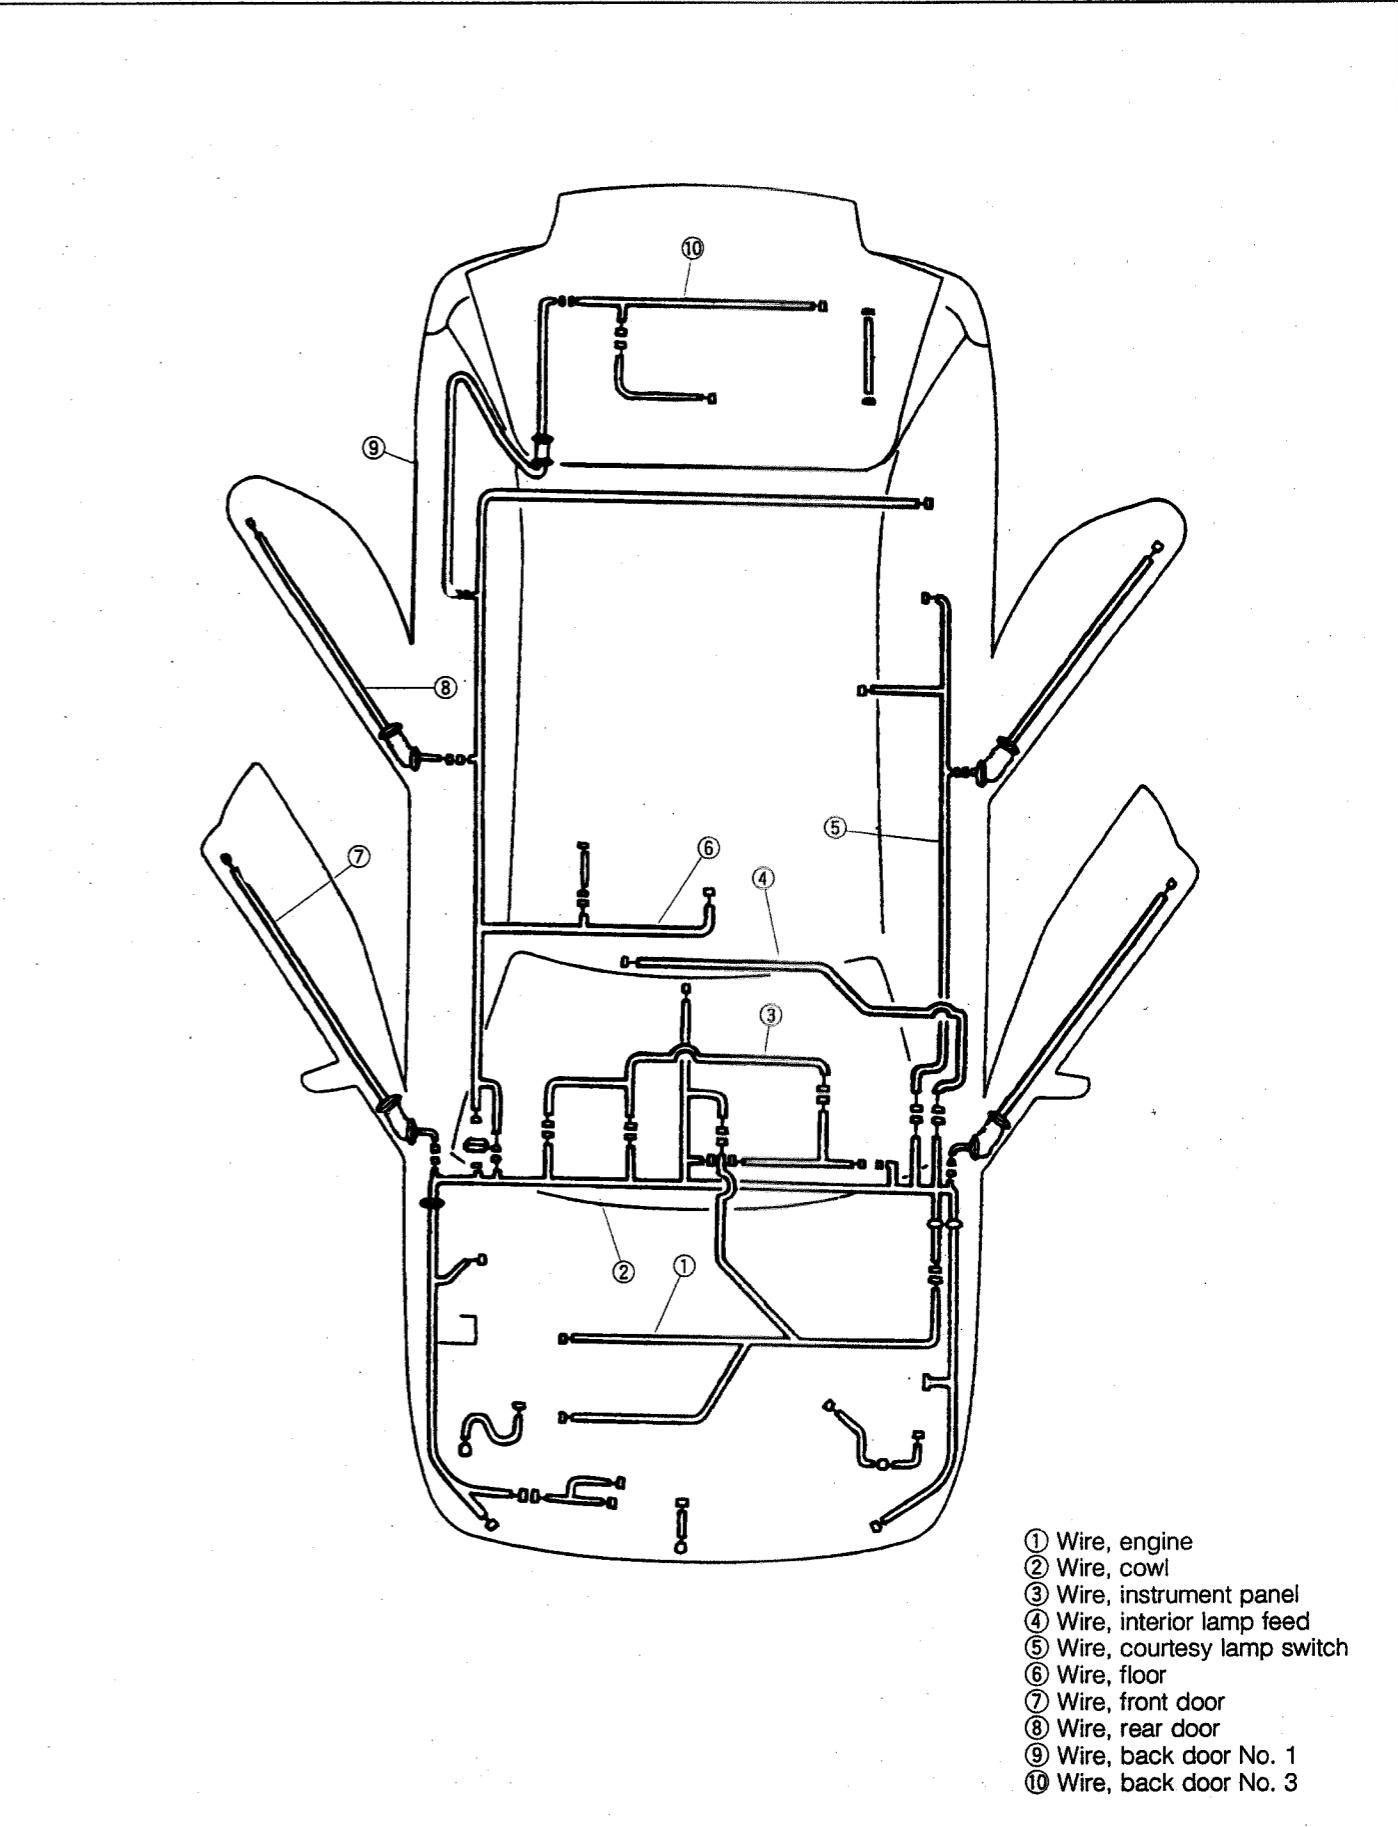

- Remove a melt fuse or fusible link.
- Disconnect all connectors for loads being applied to the melt fuse.
- Connect a test lamp at the position where the melt fuse or fusible link was installed.
- Search for the short circuit by providing the minimum conditions which make the test lamp glow.

- Perform repairs or wiring harness replacement, as required.

JUNCTION BLOCK (Main fuse block)

The junction block assembly is located underneath the instrument panel at the driver's foot side.

**SCHEMATIC DIAGRAM OF WIRING HARNESES**

WIRE CONNECTION

This table shows connections between respective terminals of the wiring harness. The terminal numbers in the right column (To) of the table are listed in an alphabetical order.
